

Annual Drinking Water Quality Report

Town of Rich Creek – PWSID 1071700

INTRODUCTION

This Annual Drinking Water Quality Report for calendar year 2020 is designed to inform you about your drinking water quality. Our goal is to provide you with a safe and dependable supply of drinking water, and we want you to understand the efforts we make to protect your water supply. The quality of your drinking water must meet state and federal requirements administered by the Virginia Department of Health (VDH).

If you have questions about this report, please contact:

Roger Jones (540) 726 – 3260, Monday – Friday, between the hours of 9:00 A.M. and 4:00 P.M.

If you want additional information about any aspect of your drinking water or want to know how to participate in decisions that may affect the quality of your drinking water, please contact:

Mayor William Kantsios (540) 726 – 3260, Monday – Friday, after 4:00 P.M.

The times and location of regularly scheduled board meetings are as follows:

2nd Monday of each month at 6:00 P.M. At the Town Hall

GENERAL INFORMATION

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include: (i) microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; (ii) inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming; (iii) pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses; (iv) organic chemical contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems; (v) radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer who are undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

SOURCE(S) and TREATMENT OF YOUR DRINKING WATER

The source of your drinking water is groundwater under the direct influence of surface water as described below:

Your drinking water is purchased from the Giles County PSA. The PSA obtains its water from a well located in the Town of Pearisburg.

Is there any treatment of your drinking water supply? (X) Yes () No
Chlorine is added to the water to disinfect it. Disinfection is the primary method of inactivating microorganisms. A free chlorine residual is maintained throughout the distribution system to prevent the possibility of bacteria regrowth.

The Virginia Department of Health conducted a source water assessment of our system during 2002. The well was determined to be of high susceptibility to contamination using the criteria developed by the state in its approved Source Water Assessment Program. The assessment report consists of maps showing the source water assessment area, an inventory of known land use activities of concern, and documentation of any known contamination. The report is available by contacting Mr. Kevin Belcher, Giles County Public Service Authority at (540) 921-2525.

DEFINITIONS

Contaminants in your drinking water are routinely monitored according to Federal and State regulations. The table on the next page shows the results of our monitoring for the period of January 1st to December 31st, 2020. In the table and elsewhere in this report you will find many terms and abbreviations you might not be familiar with. The following definitions are provided to help you better understand these terms:

Maximum Contaminant Level, or MCL - the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal, or MCLG - the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level Goal or MRDLG: the level of drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Maximum Residual Disinfectant Level or MRDL: the highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Non-detects (ND) - lab analysis indicates that the contaminant is not present

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Picocuries per liter (pCi/L) - picocuries per liter is a measure of the radioactivity in water.

Action Level (AL) - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Treatment Technique (TT) - a required process intended to reduce the level of a contaminant in drinking water.

Level 1 assessment - a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found in our water system.

Level 2 assessment - a very detailed study of the waterworks to identify potential problems and determine (if possible) why an *E. coli* PMCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions.

Nephelometric Turbidity Unit (NTU) - nephelometric turbidity unit is a measure of the clarity, or cloudiness, of water. Turbidity in excess of 5 NTU is just noticeable to the average person. Turbidity is monitored because it is a good indicator of the effectiveness of our filtration system.

WATER QUALITY RESULTS

Regulated Contaminants							
Contaminant (units)	MCLG	MCL	Level Detected	Violation (Y/N)	Range	Date of Sample	Typical Source of Contamination
Nitrate (ppm)	10	10	0.92	N	NA	11/25/20	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits
Fluoride (ppm)	4	4	0.92	N	NA	11/25/20	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Barium (ppm)	2	2	0.0181	N	NA	11/25/20	Discharge of drilling waste; Discharge from metal refineries; Erosion of natural deposits
Alpha Emitters (pCi/l)	0	15	0.95	N	NA	3/19/19	Erosion of Natural Deposits
Chlorine (ppm)	MRDLG = 4	MRDL = 4	0.75	N	0.50 – 1.21	2020	Water additive used to control microbes
Haloacetic Acids (ppb)	NA	60	9.9	N	NA	2019	By-product of drinking water disinfection
Total Trihalomethanes (ppb)	NA	80	19	N	NA	2019	By-product of drinking water disinfection
Turbidity	NA	TT, 1 NTU Max TT, ≤ 0.3 NTU 95% of the time	0.074	N	NA	1/23/20	Soil runoff
			100%	N		daily	

Lead and Copper Contaminants

Contaminant (units)	MCLG	Action Level	90 th Percentile	Date of Sampling	# of Sampling Sites Exceeding Action Level	Typical Source of Contamination
Lead (ppb)	0	AL = 15	3.2	2017	1	Corrosion of household plumbing systems; Erosion of natural deposits
Copper (ppm)	1.3	AL = 1.3	0.2	2017	0	Corrosion of household plumbing systems; Erosion of natural deposits

Monitoring Results for Sodium (Unregulated-No Limits Designated)

Level Detected (unit)	Sample Date	Typical Source	Guidance
3.07 (mg/L)	2019	Naturally Occurring; Addition of treatment chemicals/processes	For individuals on a very low sodium diet (500 mg/day), EPA recommends that drinking-water sodium not exceed 20 mg/L.
Range: NA			Should you have a health concern, contact your health care provider.

The state allows us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data presented in the above tables, though accurate, is more than one year old.

MCL's are set at very stringent levels by the U.S. Environmental Protection Agency. In developing the standards EPA assumes that the average adult drinks 2 liters of water each day throughout a 70-year life span. EPA generally sets MCLs at levels that will result in no adverse health effects for some contaminants or a one-in-ten-thousand to one-in-a-million chance of having the described health effect for other contaminants.

VIOLATION INFORMATION – Did any monitoring, reporting, or other violations occur during the year? (X) Yes () No
If yes, an explanation of the violation, including potential health effects, and actions we are taking to correct the violation, is as follows:

During June 1 – September 30, 2020, we failed to collect the proper number of samples for lead and copper examination. Ten samples were required and none were submitted for analysis. We will collect and submit for analysis the correct number of samples during 2021. The health effects as a result of not sampling are unknown.

During the third calendar quarter (July – September) 2020 we failed to collect the proper number of samples for TTHM and HAA5 examination. One dual set of samples was required and none was submitted for analysis. We will collect and submit for analysis the correct number of samples during the third calendar quarter of 2021. The health effects as a result of not sampling are unknown.

ADDITIONAL HEALTH INFORMATION

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. [NAME OF UTILITY] is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (800-426-4791).

**NOTICE TO CONSUMERS
of the Town of Rich Creek Waterworks
Waterworks ID No. 1071700**

We have been advised by State health officials of a failure to perform required monitoring in accordance with the Commonwealth of Virginia/State Board of Health *Waterworks Regulations*.

We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During the third calendar quarter (July through September) 2020 monitoring period, we did not monitor for total trihalomethanes and haloacetic acids and therefore, cannot be sure of the quality of our drinking water during that time.

State health officials feel there is little need for concern about the safety of your water because past records show that our system has had no documented problems with total trihalomethanes and haloacetic acids contamination; however, routine sampling and analysis is required to determine the quality of water delivered to our customers.

There is nothing you need to do at this time.

We plan to collect the sample for analysis by September 30, 2021.

For more information, please contact:

Town of Rich Creek
P.O. Box 65, Rich Creek, VA 21147 (mailing address)
(540) 726-3260 (telephone number)

Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.

NOTICE TO CONSUMERS

of the

Town of Rich Creek WATERWORKS

Waterworks ID No. 1071700

We have been advised by State health officials of a failure to perform required monitoring in accordance with the Commonwealth of Virginia/State Board of Health *Waterworks Regulations*.

We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During the sampling period June 1 through September 30, 2020, we did not complete required monitoring for lead and copper tap samples and therefore cannot be sure of the quality of our drinking water during that time.

Ten samples were required for analysis and zero were analyzed.

State health officials feel there is little need for concern about the safety of your water because past records show that our waterworks has had no recent documented problems with lead and copper content in tap water samples; however, routine sampling and analysis is required to determine the quality of water delivered to our customers.

There is nothing you need to do at this time.

We plan to collect lead and copper tap samples for analysis during the June 1 through September 30, 2021, sampling period.

For more information, please contact:

Town of Rich Creek (owner or operator)
P.O. Box 65, Rich Creek VA 24147 (mailing address)
(540) 726-3260 (telephone number)

Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.
